Executive Summary of Requirements

REQUIREMENT: What is this about?

This appears to be about setting up a Flask server for a SafeRaah B2 module, specifically creating a backend API to analyze video files for accident detection. The code provided is for the main server file, `app.py`, which includes logic for loading a machine learning model, handling video uploads, and returning analysis results. The API endpoint `/analyze` accepts POST requests with a video file and returns a JSON response with the analysis results, including accident detection status and confidence scores.

As a Senior Proposal Manager, I would summarize this as a technical implementation of a video analysis API for accident detection, utilizing machine learning models and Flask server technology.

Please let me know if you would like me to elaborate or provide further clarification.
